SIT313 Secure Frontend Applications — P2 Report

Welcome Email

Name: Lav
Unit: SIT313 – Secure Frontend Applications
Task: P2 – Welcome Email
Student ID: [2510999052]

1. Introduction

The purpose of this task was to extend my DEV@Deakin web platform by adding a newsletter subscription feature.

The feature allows a user to enter their email address and click the **Subscribe** button. The frontend then sends the email address to an ExpressJS backend.

2. DEV@Deakin Platform

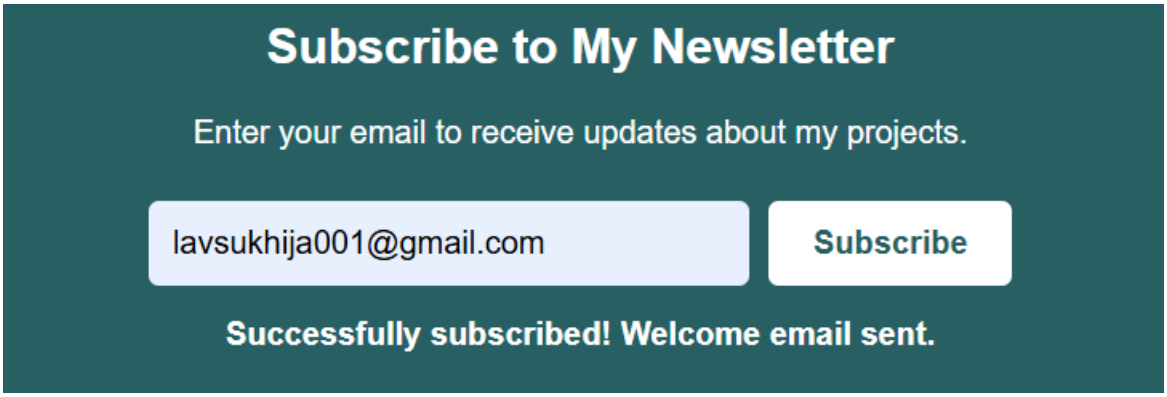

I extended my existing DEV@Deakin website by adding a Subscribe section.

The section contains:

- An email input field
- A Subscribe button
- A message area to display the result
- JavaScript to send the email address to the backend

3. Testing

I tested the subscription feature by entering an email address into the Subscribe form and submitting it.

Figure 2:

This task allowed me to extend my DEV@Deakin platform with a newsletter subscription system.

Website Design Improvements

I updated the design of my personal website to make it look cleaner, more organised, and easier to navigate. I improved the styling using CSS and kept the website focused on the main sections, including About Me, My Projects, My Gallery, Contact Me, and Newsletter Subscription.

The updated design maintains the newsletter subscription functionality, which is connected to the backend using the SendGrid Email API. These changes improved the website's visual appearance while keeping its main features working.
